Bradbury Real Estate

The house being presented by **Fast and Friends** is the home described from the short story “There Will Come Soft Rains” by Ray Bradbury. The home is state of the art with many useful features and appliances. There are many smart and automatic features that make tasks easier for people with special needs due to a disability of some sort. **The house is not only useful with its many appliances, but it is also usable with its many rooms and spaciousness, and it is also desirable with its grand design and state of the art technology.**

**The house consists of many safety and cleaning rats, walls, and built in ceiling speakers.** A version of these rats are copper scrapped rats that are designed to come out of the walls and help clean any unwanted trash. An example of the trash that it can clean is dust, paper, or even hair; these pieces will be ‘consumed’ by the copper scrapped rats' small steel jaws and from there the trash will be transported to tubes and lead to an incinerator, which is inside of the cellar. **Additionally,** another version of the rats that the home has are the water rats that hold water and move toward fire and shoot water at it, while this is happening the walls are able to let mechanical rain down. **Moreover** there are more safety features that the home has which include speakers within the ceilings in order to alert people who are in the home that there is a form of danger like a fire; another safety feature that the home has is voice recognition doors in order to let people who the house knows into the home. **In addition,** other useful features that the home has are self heating beds, dishes that are cleaned automatically, and a cigar dispenser.

The home is state of the art with many features including a kitchen that is able to cook food for its members, voice recognition doors, automatic garage doors, smart bathrooms, and speakers. The kitchen is able to cook food for its members including toast, sunny side up eggs, bacon, coffee, and milk; along with these pieces of food, the kitchen does have some other useful machines like a breakfast stove. In addition the house also includes voice recognition doors, meaning there is no need for a key, the voice recognition is so smart that it can even recognize pets, like dogs. Additionally, alongside the voice recognition doors the home also includes automatic garage doors. Within the home automation, the house is able to give a warm clear water bath.

The homes' automation is able to do many tasks that a member of the home wants or needs, whether that is cleaning dishes, kitchen automation appliances, reading a desired poem, or warming the bed. The home is quite large and spacious while including a study, nursery, and even automated kitchen. Furthermore, the home not only has these rooms but it also has a cellar, sub cellar, and even a parlor which can be quite useful and convenient to have some rooms dedicated for guests to hang out in and relax or even have a get together or a party of some sort. Also, the home is quite modern with all of these smart and automated features making it safe and reliable for all members of the home to feel at ease and comfortable. Moreover, the home is not only smart and advanced, it is also quite large as it has five stories which are the sub cellar, cellar, main level, upstairs, and the attic.

There are many people who will want this home as it is state of the art, spacious, and large. There are people who would want some of the features, as it will make their lives easier, and for many buyers, they may know somebody who can't access certain appliances because of a type of disability or needs, and even children, while most homes don't have the right appliances

to make it easier for them to access them. Furthermore, with this home there are numerous appliances that can help aid people's day to day lives, making them easier and more efficient if needed. Moreover, some examples of the appliances that can help aid people's needs are the automatic dishwasher, allowing the dishes to get clean with no human activity, another example would be the voice recognition doors that can help those with shoulder problems, some sort of injury, disability, or even help prevent robbery. Overall the home is something that cannot be beaten in appliances, convenience, and its usefulness for many groups of people.
